Fe Simulation Of Welding Distortion

Finite element simulation proved to be a proficient tool to predict welding distortion and residual stresses in welded structures with accuracy -. In this study, equivalent load method based on inherent strain theory is used to predict welding deformation and residual stresses in butt welded plates.

As welding procedure is usually selected for reasons of quality and productivity, the welder has limited scope for reducing distortion. As a general rule, weld volume should be kept to a minimum. Also, the welding sequence and technique should aim to balance the thermally induced stresses around the neutral axis of the component.
